

## NON-INVASIVE PRENATAL PATERNITY TEST (LEGAL)

### HOW IS THIS TEST PERFORMED?

The process is simple. Genetic material is obtained from the mother and the alleged father. The lab will then create a profile of the fetus's DNA, and compare it to the DNA profile of the alleged father.

### WHY MIGHT I HAVE THIS TEST DONE?

This test is useful for people who are interested in determining the biological father of a child. **These test results are legally admissible.**

If you are just looking for a non-invasive prenatal paternity test that can provide answers and peace of mind, and you are not planning to use the results for any kind of legal purpose, you may consider an informational non-invasive prenatal paternity test (keep in mind that the results from the informational test are not legally admissible). However, if there is any chance that the results might be needed for legal reasons, then a Legal Non-Invasive Prenatal Paternity Test should be performed.

### HOW ARE THE RESULTS REPORTED?

Our paternity test results report contains the following main sections:

- Probability of Relationship
- Test Conclusions

The test results will reflect the probability of paternity. A “0” means that the alleged father is likely not the biological father.

An extremely high probability of paternity indicates that the alleged father is likely the biological father (generally greater than 99%). A low probability of paternity indicates that the alleged father is likely not the biological father.
