

SIBLINGSHIP TEST- INFORMATIONAL (NON-LEGAL)

HOW IS THIS TEST PERFORMED?

The process is simple. Genetic material is obtained from all participating siblings and a known parent via a soft swab on the inside of both cheeks.

Adding a known parent to a Siblingship DNA Test will greatly increase the conclusiveness of the test and is highly recommended. If two siblings are trying to determine whether or not they have the same father, the known mother's participation is also encouraged. If the mother is tested along with the siblings, the mother's DNA will be compared to her children. The remaining DNA will have been contributed from their father(s).

The cost of our Siblingship DNA Test includes testing two siblings and one known parent. If more than two siblings and one known parent participate in the testing, additional fees will be incurred.

WHY MIGHT I HAVE THIS TEST DONE?

This test is useful for people who are interested in determining the likelihood that two individuals are siblings. **This is an informational siblingship test only.** The results can provide you with valuable information and peace of mind, but they cannot be used for legal purposes. If you plan to use these test results for legal purposes, please check out our Siblingship Legal test.

HOW ARE THE RESULTS REPORTED?

The test results will reflect the likelihood of a biological relationship.

If the siblingship index is greater than 1.00, this indicates that the tested individuals are more likely to be true biological relatives. The higher the value of the index, the greater the likelihood that the individuals are true biological relatives.

If the siblingship index is less than 1.00, this indicates that the tested individuals are not likely to be true biological relatives. The lower the value of the index, the smaller the likelihood that the individuals are true biological relatives.
